

ShowLED Animation

ShowLED Animation is really designed to animate, in other words, to give a backdrop some extra dynamism. We witnessed an international demand for a starcloth with something extra.

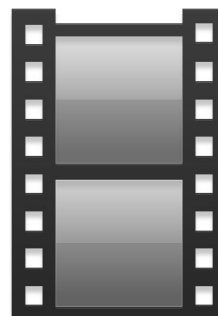

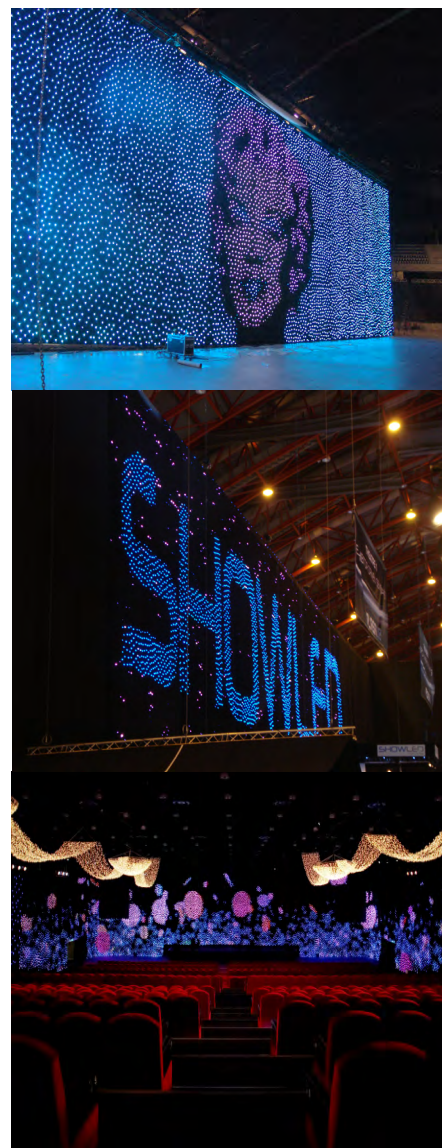

Differing from most existing "LED to fabric" applications ShowLED Animation retains randomly positioned LEDs, with a significantly raised density. The LEDs are individually controlled as pixels to create low to medium resolution still images, video loops and flash animations. Prepare to be amazed at what the Animation system has to offer.

To achieve the required flexibility the system uses an upgraded custom high frequency communication protocol, that was featured in the Chameleon system. The control topology allows every RGB LED to be individually addressed, as such achieving full additive colour mixing and individual pixel control. An ultra fast data transfer facility offers unique opportunities to display different layers and insert instant breaks.

A New & Innovative
ShowLED system that combines
"in house" starcloth technology
with Upgraded Pixel Control

Technical Information:

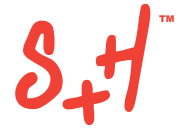

- High Quality 5mm RGB LEDs
- 31 LEDs per sqm
- Max 1024 LEDs per controller
- 24V Output Voltage
- MoltonCS Front Fabric, DekoTaftCS Rear Fabric
- 100% Trevira CS Flame Retardant
- Video control using either ArKaos, Martin Maxedia or ShowLED V-Box to run on any Media Server
